

Windows 11 Installation Process

1. Check System Requirements

- **Processor:** 1 GHz or faster with at least 2 cores on a compatible 64-bit processor.
- **RAM:** 4 GB or more.
- **Storage:** 64 GB or larger storage device.
- **System Firmware:** UEFI, Secure Boot capable.
- **TPM:** Trusted Platform Module (TPM) version 2.0.
- **Graphics Card:** DirectX 12 compatible graphics / WDDM 2.x.
- **Display:** >9" with HD Resolution (720p).
- **Internet Connection:** Internet connectivity is necessary to perform updates and to download and take advantage of some features.

2. Backup Important Data

- Ensure you backup your important files and data to an external drive or cloud storage.

3. Download Windows 11 Installation Media

- Visit the [Microsoft Windows 11 Download Page](https://www.microsoft.com/software-download/windows11) (https://www.microsoft.com/software-download/windows11)
- Click on "Download now" under the Windows 11 Installation Assistant.

4. Run the Installation Assistant

- Open the downloaded file (Windows11InstallationAssistant.exe).
- Follow the on-screen prompts:
 - Accept the Licence Terms.
 - The assistant will check your PC for compatibility.
 - If your PC is compatible, click "Next" to begin the installation.
 - The tool will download Windows 11 and start the installation process.
 - Your PC will restart several times during the installation process.

5. Complete Installation

- After the final restart, you'll see the Windows 11 setup screen.
- Follow the on-screen prompts to:
 - Choose your region and keyboard layout.
 - Connect to a network.
 - Set up your account (Microsoft account recommended).
 - Configure privacy settings.
 - Customise your preferences (e.g., language, time zone).

6. Post-Installation

- Check for updates:
 - Go to **Settings -> Windows Update -> Check for updates**.

- Install necessary drivers and software:
 - Visit your PC manufacturer's website for the latest drivers.
 - Reinstall essential applications.

Git Installation and Configuration on Windows

1. Download Git

- Visit the [Git official website](https://git-scm.com/) (https://git-scm.com/).
- Click on the "Download for Windows" button to download the installer.

2. Install Git

- Locate the downloaded file (typically `Git-<version>-64-bit.exe`) and double-click to run the installer.
- **Setup Wizard Steps:**
 1. **Welcome Screen:** Click "Next".
 2. **Select Destination Location:** Choose the default or specify a different location, then click "Next".
 3. **Select Components:** Leave the default options checked, then click "Next".
 4. **Select Start Menu Folder:** Click "Next" to use the default folder.
 5. **Choosing the default editor used by Git:** Select your preferred text editor (e.g., Visual Studio Code), then click "Next".
 6. **Adjusting your PATH environment:** Choose "Git from the command line and also from 3rd-party software", then click "Next".
 7. **Choosing HTTPS transport backend:** Select "Use the OpenSSL library", then click "Next".
 8. **Configuring the line ending conversions:** Select "Checkout Windows-style, commit Unix-style line endings", then click "Next".
 9. **Configuring the terminal emulator to use with Git Bash:** Choose "Use MinTTY (the default terminal of MSYS2)", then click "Next".
 10. **Choosing the default behavior of `git pull`:** Leave the default option selected, then click "Next".
 11. **Choose a credential helper:** Select "Git Credential Manager", then click "Next".
 12. **Configuring extra options:** Leave the default options checked, then click "Next".
 13. **Configuring experimental options:** Uncheck any experimental options unless you want to try them, then click "Install".
- Wait for the installation to complete, then click "Finish".

3. Verify Installation

- Open Command Prompt or PowerShell.
- Type `git --version` and press Enter to verify Git is installed correctly.

4. Configure Git

- **Open Git Bash** (installed with Git):

Set your username:

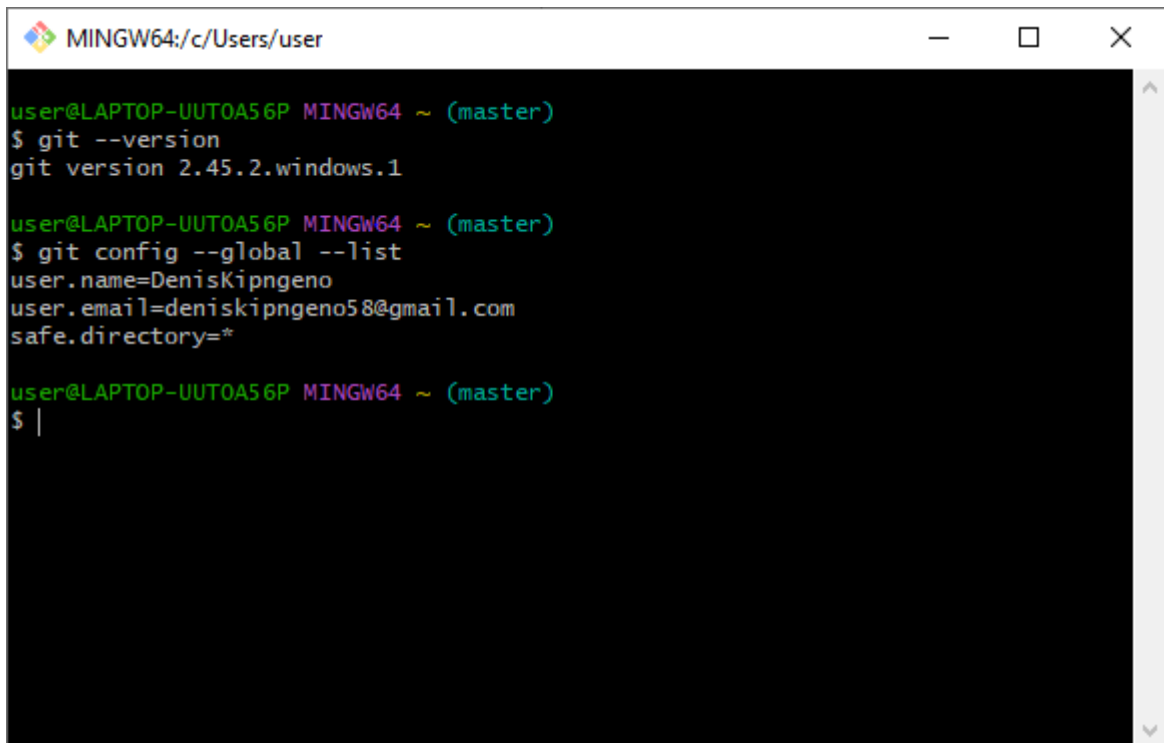

```
git config --global user.name "Your Name"
```

Set your email:

```
git config --global user.email "youremail@example.com"
```

Verify the configuration:

```
git config --list
```

A screenshot of a Git Bash terminal window. The title bar shows 'MINGW64:/c/Users/user'. The terminal content shows the following commands and output:

```
user@LAPTOP-UUTOA56P MINGW64 ~ (master)
$ git --version
git version 2.45.2.windows.1

user@LAPTOP-UUTOA56P MINGW64 ~ (master)
$ git config --global --list
user.name=Deniskipngeno
user.email=deniskipngeno58@gmail.com
safe.directory=*
```

5. Add Git to PATH (If not already done during installation)

- **Manually Adding Git to PATH:**
 1. **Open System Properties:**
 - Press **Windows + X**, select "System", then click "Advanced system settings".
 2. **Environment Variables:**
 - In the System Properties window, click on "Environment Variables".
 3. **Edit Path Variable:**
 - In the Environment Variables window, find the "Path" variable under "System variables" and select it, then click "Edit".
 4. **Add Git to Path:**

In the Edit Environment Variable window, click "New" and add the path to your Git **bin** and **cmd** directories. Typically:

```
C:\Program Files\Git\bin
```

C:\Program Files\Git\cmd

5. Save and Apply:

- Click "OK" to close each window and apply the changes

Python 3.12.3 Installation and Configuration on Windows

1. Download Python 3.12.3

- Visit the [official Python website](https://www.python.org/downloads/)(https://www.python.org/downloads/).
- Click on the "Download Python 3.12.3" button.

2. Install Python 3.12.3

- Locate the downloaded file (typically `python-3.12.3-amd64.exe`) and double-click to run the installer.
- **Setup Wizard Steps:**
 1. **Welcome Screen:**
 - Check the box "Add Python 3.12 to PATH".
 - Click "Customise installation".
 2. **Optional Features:**
 - Ensure all options are checked (pip, tcl/tk and IDLE, Documentation, etc.).
 - Click "Next".
 3. **Advanced Options:**
 - Check "Install for all users".
 - Ensure "Add Python to environment variables" is checked.
 - Optionally, customise the installation location (default is usually fine).
 - Click "Install".
 4. **Wait for Installation:**
 - The installer will download and install Python.
 - Click "Close" once the installation is complete.

3. Verify Installation

- Open Command Prompt or PowerShell.
- Type `python --version` and press Enter to verify Python is installed correctly.
- Type `pip --version` to ensure pip, the Python package installer, is also installed.

4. Configure Python (if not added to PATH during installation)

- **Manually Adding Python to PATH:**
 1. **Open System Properties:**
 - Press `Windows + X`, select "System", then click "Advanced system settings".

2. Environment Variables:

- In the System Properties window, click on "Environment Variables".

3. Edit Path Variable:

- In the Environment Variables window, find the "Path" variable under "System variables" and select it, then click "Edit".

4. Add Python to Path:

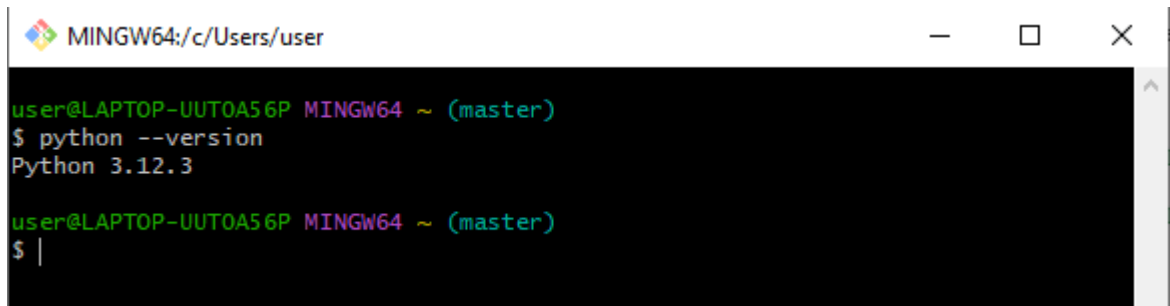

In the Edit Environment Variable window, click "New" and add the paths to the Python **Scripts** and installation directories. Typically:

`C:\Users\<YourUsername>\AppData\Local\Programs\Python\Python312`

`C:\Users\<YourUsername>\AppData\Local\Programs\Python\Python312\Scripts`

5. Save and Apply:

- Click "OK" to close each window and apply the changes.

```
MINGW64; c:/Users/user
user@LAPTOP-UUTOA56P MINGW64 ~ (master)
$ python --version
Python 3.12.3
user@LAPTOP-UUTOA56P MINGW64 ~ (master)
$ |
```

Dart SDK 3.4.3 Installation and Configuration on Windows

1. Download Dart SDK

- Visit the Dart SDK download page.
- Under the "Get the Dart SDK" section, click on the "Download" button for Windows.
- Select the latest stable release, which is **Dart SDK version: 3.4.3**.

2. Install Dart SDK

- Locate the downloaded file (usually a ZIP archive, e.g., `dartsdk-windows-x64-release.zip`) and extract its contents.

Extract the contents to a directory of your choice, for example:

`C:\dart-sdk`

-

3. Configure Dart SDK to PATH

- **Open System Properties:**

- Press **Windows + X**, select "System", then click "Advanced system settings".
- **Environment Variables:**
 - In the System Properties window, click on "Environment Variables".
- **Edit Path Variable:**
 - In the Environment Variables window, find the "Path" variable under "System variables" and select it, then click "Edit".
- **Add Dart SDK to Path:**

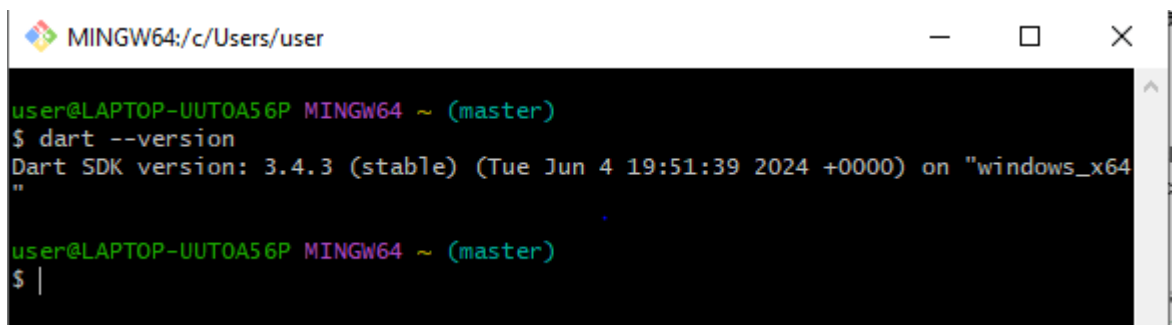

In the Edit Environment Variable window, click "New" and add the path to the **bin** directory of the Dart SDK. For example:

C:\dart-sdk\bin

- **Save and Apply:**
 - Click "OK" to close each window and apply the changes.

4. Verify Installation

- Open Command Prompt or PowerShell.
- Type **dart --version** and press Enter to verify Dart is installed correctly.

```

MINGW64:/c:/Users/user
user@LAPTOP-UUTOA56P MINGW64 ~ (master)
$ dart --version
Dart SDK version: 3.4.3 (stable) (Tue Jun 4 19:51:39 2024 +0000) on "windows_x64"

user@LAPTOP-UUTOA56P MINGW64 ~ (master)

Flutter 3.22.2 Installation and Configuration on Windows 11

1. Download Flutter SDK

- Visit the Flutter SDK download page.
- Under the "Get the Flutter SDK" section, click on the "Download" button for Windows to download the latest stable release, which is **Flutter version: 3.22.2**.

2. Extract Flutter SDK

- Locate the downloaded file (usually a ZIP archive, e.g., **flutter_windows_3.22.2-stable.zip**) and extract its contents.

Extract the contents to a directory of your choice, for example:

C:\flutter

3. Configure Flutter SDK to PATH

- **Open System Properties:**
 - Press **Windows + X**, select "System", then click "Advanced system settings".
- **Environment Variables:**
 - In the System Properties window, click on "Environment Variables".
- **Edit Path Variable:**
 - In the Environment Variables window, find the "Path" variable under "System variables" and select it, then click "Edit".
- **Add Flutter SDK to Path:**

In the Edit Environment Variable window, click "New" and add the path to the **bin** directory of the Flutter SDK. For example:

C:\flutter\bin

- **Save and Apply:**
 - Click "OK" to close each window and apply the changes.

4. Verify Installation

- Open Command Prompt or PowerShell.

Run the following command to ensure Flutter is installed correctly:

flutter --version

Run the following command to verify the setup:

flutter doctor

- Follow any additional instructions provided by **flutter doctor** to complete the setup (e.g., installing additional dependencies).

5. Optional: Install Additional Tools

- **Android Studio:**
 - Install Android Studio if you plan to develop for Android.
 - Follow the [Android Studio installation guide](https://developer.android.com/studio) (https://developer.android.com/studio).
- **Visual Studio Code:**
 - Install Visual Studio Code if you prefer it as your IDE.
 - Follow the [Visual Studio Code installation guide](https://code.visualstudio.com/).(https://code.visualstudio.com/)
 - Install Flutter and Dart extensions from the Extensions Marketplace.

```
MINGW64/c/Users/user
user@LAPTOP-UUTOA56P MINGW64 ~ (master)
$ flutter --version
Flutter 3.22.2 • channel stable • https://github.com/flutter/flutter.git
Framework • revision 761747bf5 (12 days ago) • 2024-06-05 22:15:13 +0200
Engine • revision ead846116
Tools • Dart 3.4.3 • DevTools 2.34.3

user@LAPTOP-UUTOA56P MINGW64 ~ (master)
$ flutter doctor
Doctor summary (to see all details, run flutter doctor -v):
[!] Flutter (Channel stable, 3.22.2, on Microsoft Windows [Version 10.0.19045.4529], locale en-KE)
    ! Warning: 'dart' on your path resolves to C:\dartsdk-windows-x64-release\dart-sdk\bin\dart.exe, which is not inside your current Flutter SDK checkout at C:\Flutter. Consider adding C:\Flutter\bin to the front of your path.
[✓] Windows Version (Installed version of Windows is version 10 or higher)
[X] Android toolchain - develop for Android devices
    X Unable to locate Android SDK.
       Install Android Studio from: https://developer.android.com/studio/index.html
       On first launch it will assist you in installing the Android SDK component
       (or visit https://flutter.dev/docs/get-started/install/windows#android-setup for detailed instructions).
       If the Android SDK has been installed to a custom location, please use
       'flutter config --android-sdk' to update to that location.
[✓] Chrome - develop for the web
[X] Visual Studio - develop Windows apps
    X Visual Studio not installed; this is necessary to develop Windows apps.
       Download at https://visualstudio.microsoft.com/downloads/.
       Please install the "Desktop development with C++" workload, including all
       of its default components
[!] Android Studio (not installed)
[✓] VS Code (version 1.90.0)
[✓] Connected device (3 available)
[✓] Network resources

Visual Studio Code Installation and Configuration on Windows 11

1. Download Visual Studio Code

- Visit the [Visual Studio Code website](https://code.visualstudio.com/) (https://code.visualstudio.com/).
- Click on the "Download for Windows" button to download the latest version of Visual Studio Code.

2. Install Visual Studio Code

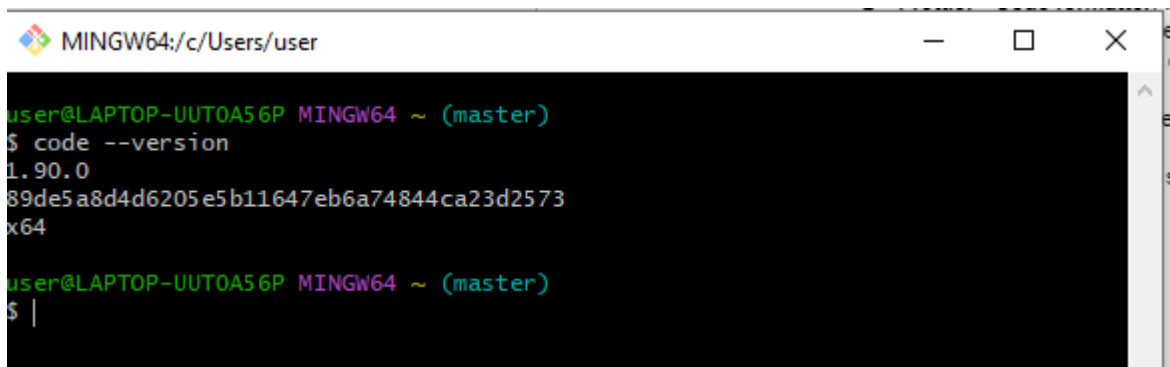

- Locate the downloaded file (typically `VSCodeUserSetup-x64-<version>.exe`) and double-click to run the installer.
- **Setup Wizard Steps:**
 1. **Welcome Screen:** Click "Next".
 2. **License Agreement:** Accept the license agreement and click "Next".
 3. **Select Destination Location:** Choose the default or specify a different location, then click "Next".
 4. **Select Start Menu Folder:** Click "Next" to use the default folder.
 5. **Select Additional Tasks:**
 - Check the box "Add to PATH (requires shell restart)".
 - Optionally check other boxes like "Create a desktop icon" and "Add to context menu".
 - Click "Next".
 6. **Ready to Install:** Click "Install".
 7. **Complete Installation:** Click "Finish" to launch Visual Studio Code.

3. Verify Installation

- Open Command Prompt or PowerShell.
- Type `code --version` and press Enter to verify Visual Studio Code is installed correctly and accessible from the PATH.

4. Configure Visual Studio Code

- **Launch Visual Studio Code:**
 - Open Visual Studio Code from the Start Menu or desktop shortcut.
- **Install Recommended Extensions:**
 - Open the Extensions view by clicking on the Extensions icon in the Activity Bar on the side of the window.
 - Search for and install essential extensions such as:
 - **Python:** For Python development.
 - **Prettier - Code formatter:** For code formatting.
 - **ESLint:** For JavaScript/TypeScript linting.
 - **GitLens:** For enhanced Git capabilities.
- **Customize Settings:**
 - Open the settings by clicking on the gear icon in the lower-left corner and selecting "Settings".
 - Adjust settings to your preference, such as theme, font size, and keybindings.

```

MySQL Installation and Configuration on Windows 11

1. Download MySQL Installer

- Visit the [MySQL Downloads page](#).
- Click on the "Download" button for the MySQL Installer for Windows (typically `mysql-installer-web-community`).

2. Install MySQL

- Locate the downloaded file (`mysql-installer-web-community-<version>.exe`) and double-click to run the installer.
- **Setup Wizard Steps:**
 1. **Welcome Screen:** Click "Next".
 2. **Choosing a Setup Type:**
 - Select "Developer Default" for a full MySQL installation, or customize based on your needs.
 - Click "Next".

3. **Check Requirements:** The installer will check for any missing requirements. Click "Execute" to install any required software, then click "Next".
4. **Installation:** Click "Execute" to begin installing MySQL products. Once completed, click "Next".
5. **Product Configuration:** Click "Next" to start the configuration process.

3. Configure MySQL Server

- **Type and Networking:**
 - Choose "Standalone MySQL Server / Classic MySQL Replication".
 - Select the default TCP/IP port (3306) and ensure "Open Windows Firewall port for network access" is checked.
 - Click "Next".
- **Authentication Method:**
 - Choose "Use Strong Password Encryption for Authentication (RECOMMENDED)".
 - Click "Next".
- **Accounts and Roles:**
 - Set a strong password for the root user and create any additional user accounts as needed.
 - Click "Next".
- **Windows Service:**
 - Ensure "Configure MySQL Server as a Windows Service" is checked.
 - Set the service name (default is MySQL80) and select "Start the MySQL Server at System Startup".
 - Click "Next".
- **Apply Configuration:** Click "Execute" to apply the configuration settings. Once completed, click "Finish".

4. Add MySQL to PATH

- **Open System Properties:**
 - Press **Windows + X**, select "System", then click "Advanced system settings".
- **Environment Variables:**
 - In the System Properties window, click on "Environment Variables".
- **Edit Path Variable:**
 - In the Environment Variables window, find the "Path" variable under "System variables" and select it, then click "Edit".
- **Add MySQL to Path:**

In the Edit Environment Variable window, click "New" and add the path to the MySQL **bin** directory. For example:

plaintext

Copy code

C:\Program Files\MySQL\MySQL Server 8.0\bin

○

- **Save and Apply:**
 - Click "OK" to close each window and apply the changes.

5. Verify Installation

- Open Command Prompt or PowerShell.
- Type `mysql --version` and press Enter to verify MySQL is installed correctly.

Optionally, log into MySQL using the command:

```
mysql -u root -p
```

- Enter the root password set during configuration to access the MySQL shell.
